Fluid Flow – The Physics Hypertextbook

A fluid refers to any substance that is capable of flowing due to pressure difference. It includes both liquids and gases. Examples of fluid flow include: perfume spray from a perfume bottle, flow of water along a river bed, smoke from chimney etc. A flowing fluid experiences internal resistance called viscosity. Types of Fluid Flow

FLUID FLOW - Form 2 Physics Notes

Fluid mechanics is the application of the fundamental principles of mechanics and thermodynamics – such as conservation of mass, conservation of energy and Newton's laws of motion – to the study of liquids and gases, in order to explain observed phenomena and to be able to predict behaviour.

Fluid Flow Notes

When the flow is laminar, the streamlines are parallel and for flow between two parallel surfaces we may consider the flow as made up of parallel laminar layers. In a pipe these laminar layers are cylindrical and may be called stream tubes. In

laminar flow, no mixing occurs between adjacent layers and it occurs at low average velocities.

TUTORIAL No. 1 FLUID FLOW THEORY

Fluid flow Predicting fluid flow rates, pressure drops, and turbulence are just a few items that are challenging to measure during design. Understanding these performance indicators with the use of CFD simulation enables engineers to explore more ideas and make better decisions.

Steady or Unsteady Flow. Fluid flow can be steady or unsteady, depending on the fluid's velocity: Steady: In steady fluid flow, the velocity of the fluid is constant at any point.

Unsteady: When the flow is unsteady, the fluid's velocity can differ between any two points. Viscous or Non-viscous Flow.

Liquid flow can be viscous or non-viscous.
