Excel is the most accessible program for data analysis. Power Query (also known as Get & Transform) takes that one step further. The first step of any data analysis project is importing the data. Related to that, you must clean and standardize the data (aka ETL: Extract, Transform and Load) Power Query has all that covered.

[Mastering Excel: Power Query: Amazon.co.uk: Moore, Mark ...](#)

Power Query has all that covered. You will learn to set up Power Query for connecting Excel to all kinds of data sources, performing hundreds of ETL tasks and loading clean data into your worksheet. Power Query can extract data from columns, join columns, remove duplicates, skip errors, join tables, the list is almost endless.

Power Query is the first step in analyzing data, before you do any substantial analysis, you need to get the data into Excel. Not only get data into Excel but probably clean it up. Parse columns, join columns, remove errors, you know, that kind of stuff. Of course, you can add a column with formulas to do this.

Power Query will automatically include the new columns in the query and output them in the appended query. The new columns will still need to have the same column header name on each sheet. If any of the tables are missing columns, then Power Query will fill the rows for that table with blank (null) values in the append query and output table.
